FEBRUARY 2023

Fun Facts

- I've recently been voted in as the President of the ASMB. Club members keep an eye out for your invitation to the Meet and Greet we're planning for February.
- I am a new mentor for the wonderful <u>Mission Beelieve</u> program! The goal of this non-profit is to bring therapeutic beekeeping mentorship to the military, first responders, and EMS in Southern Maryland.

Fun Fact

Pheromones drive most of the communication for the honey bee colony. Chemical scent receptors and depositors on the bees' feet, abdomens, and antennae help them sense smells and deliver pheromone signals. For example, the Nasonov gland on the tail end of the honey bee delivers scent signals to bring the bees home. Guard bees on the front porch tell other bees that the Queen is inside by flexing their abdomen and exposing the Nasonov gland at the tip, then fanning the scent with their wings. Many bees line up to do this for a stronger effect in numbers.

Feed the Bees!

Keep feeding your bees! This is the time of year when colonies starve to death. They will start ramping up brood production and building up colony size to have a full foraging force come spring. Make sure that on warm days you are assessing the need for food. Add dry sugar on top or candy bars (10lb dry white sugar and 1 cup water, 1 tsp vinegar) and mix till it feels like wet sand. Pour into a flat tray, plate, or cookie sheet, and let dry overnight till hard. Place directly on the top bars using a shim or lift the inner cover above an empty honey super used as a feed surround.
